

General Description

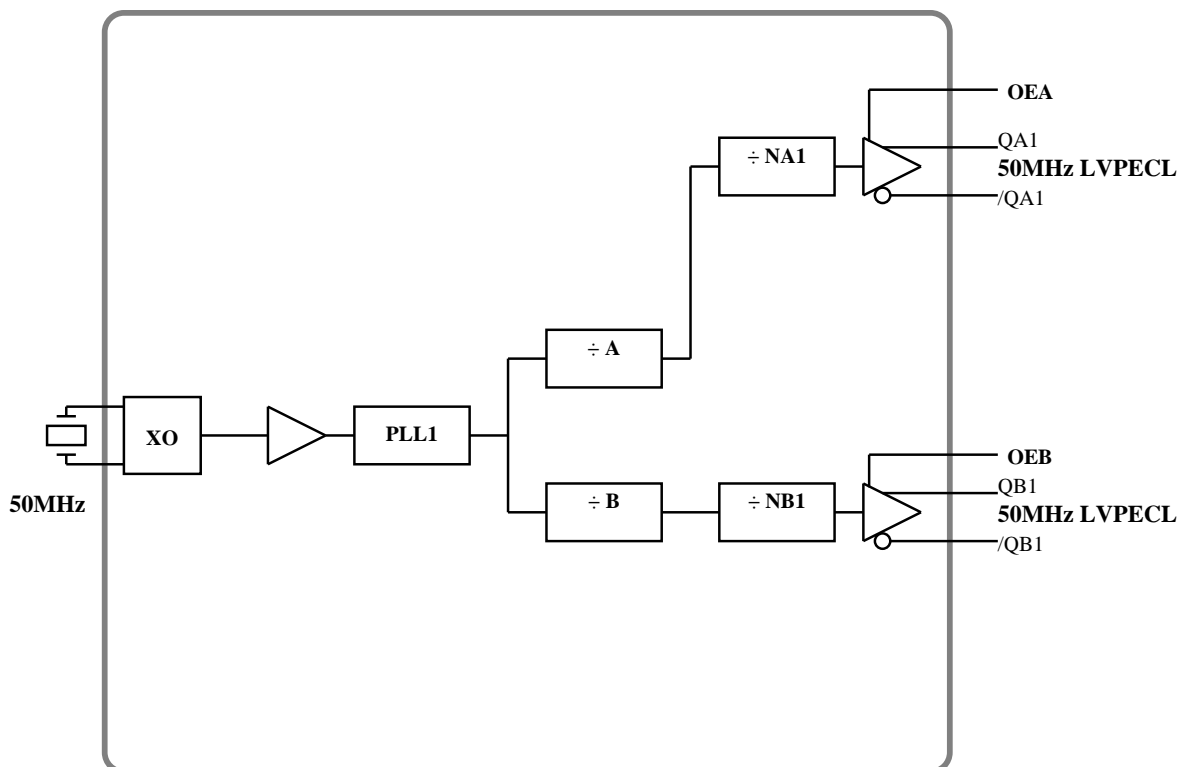

The SM806072 is a member of the ClockWorks® FLEX family of devices from Microchip and provides an extremely low-noise timing solution. It is based upon a unique PLL architecture that provides very-low phase noise.

The device operates from a 2.5V or 3.3V power supply.

Features

- Generates 2 output clocks
- Frequency and output logic:
 - 50MHz LVPECL x 2
- 50MHz Crystal Input
- OE on banks A and B
- Typical phase noise:
 - 78fs (Integration range: 12kHz-20MHz)
- On-chip power supply regulation for excellent board level power supply noise immunity
- No external crystal oscillator capacitors required
- 2.5V or 3.3V operating power supply
- Industrial temperature range
- 24-pin 4x4x.85mm VQFN

Notes:

- See Figure 'All Outputs Rise/Fall Time'
- Output-to-output skew is defined as skew between outputs at the same supply voltage and with equal load conditions. It is measured at the output differential crossing points.
- Output-to-output skew is only defined for outputs in the same PLL bank [A:B, C:D] with the same output logic type setting.
- All phase noise measurements were taken with an Agilent 5052B phase noise system.
- Measured using a 50MHz crystal as the input reference source.
- Package thermal resistance assumes the exposed pad is soldered (or equivalent) to the device's most negative potential on the PCB.

Application Information

Crystal Layout

Keep the layers under the crystal as open as possible and do not place switching signals or noisy supplies under the crystal. Crystal load capacitance is built inside the die, so no external capacitance is needed. See the *Quartz Crystals and Microchip ICs* application note ANTC207 for further details. If you need help selecting a suitable crystal for your application, contact Microchip's TCG applications group at: tcghelp@microchip.com

Output Traces

Design the traces for the output signals according to the output logic requirements. If LVCMOS is unterminated, add a 30 Ohms resistor in series with the output, as close as possible to the output pin and start a 50 Ohms trace on the other side of the resistor.

For differential traces you can either use a differential design or two separate 50 Ohms traces. For EMI reasons, it is better to use a balanced differential design.

LVDS can be AC coupled or DC coupled to its termination.

Power Supply Filtering Recommendations

Figure 1. Recommended Power Supply Filtering

- Use the power supply filtering shown in above figure for VDD, VDDA_PLL, VDDI.
- Connect the VDDO pins directly to the VDD power plane.
- Connect all VSS pins directly to the ground power plane.
- Recommended ferrite bead properties are 80 Ohms to 240 Ohms @100MHz impedance and >250mA saturation current.
- To improve power supply filtering beyond what a ferrite bead can provide, Microchip's Ripple Blocker™ provides a solution. MIC94300 or MIC94310 are recommended parts. The filter circuit with Ripple Blocker is shown in below figure and can be used for any of the above VDD sections.
- Do not use Y5V or Z5U capacitors.
